SPRINGER NATURE · RESEARCH INTEGRITY AND AI

AI Guidance for Researchers, Editors and Reviewers

A comprehensive guide to the policy framework, role-specific expectations and practical checks

Green · Permitted

Amber · Exercise caution

Red · Not permitted

Prepared from the Springer Nature guidance page · accessed 19 October 2026

OVERVIEW

What this guide covers

01

Principles and framework

Accountability, transparency and the five risk questions

02

Green, amber, red

How AI use is classified and what each class requires

03

For authors

Authorship, declaration, prompts, images and citations

04

For peer reviewers

What is permitted and the confidentiality limits

05

For editors and the publisher

Editorial accountability and Springer Nature’s own AI use

06

Detailed policies and practice

Four detailed policies, the book authors’ code, scenarios and a checklist

PRINCIPLES AND FRAMEWORK

Springer Nature’s position on AI

AI supports human expertise and never replaces it.

Scholarly judgement, accountability and responsibility always remain human.

Benefits. Used responsibly, AI can enhance discovery, broaden inclusivity and protect the trustworthiness of the scientific record.

Principles. Human-centred values underpin the AI Principles and editorial policies that authors, editors and reviewers are expected to follow.

Fact-checking. A human should always be accountable to edit and fact-check original work.

Governance. The AI Ethics and Policy Forums monitor regulation, technology and community expectations, and update the policies as needed.

PRINCIPLES AND FRAMEWORK

The assessment framework: how, not whether

Rather than asking whether AI was used, the policies ask each user to consider five questions.

1. **How AI has been used**
2. **The potential impact of that use**
3. **The level of risk introduced**
4. **Whether human oversight has been maintained**
5. **Whether transparency and accountability have been preserved**

> The framework applies consistently to authors, peer reviewers and editors, while recognising their distinct roles and responsibilities.

PRINCIPLES AND FRAMEWORK

Four core expectations

01	**Human accountability is non-transferable**	Accountability for scholarly content, evaluation and editorial decisions cannot be delegated to AI systems.
02	**AI may support, not replace, scholarly judgement**	AI can assist clarity, efficiency and exploration, but must not determine conclusions, evaluations or decisions.
03	**Transparency creates trust and confidence**	Declaring AI use openly builds trust and removes ambiguity about how AI might have been used.
04	**Confidentiality and data protection are mandatory**	Manuscripts, peer review reports and sensitive data must not be shared with unsecured or public AI systems, in compliance with local laws.

TRAFFIC-LIGHT FRAMEWORK

Three classes of AI use

Green · Permitted

Assistive AI use

Supports expression, organisation or efficiency without influencing scientific, scholarly or evaluative judgement.

Amber · Exercise caution

Evaluative or interpretive AI use

May influence interpretation, framing, emphasis or evaluative judgement, but remains under human control.

Red · Not permitted

AI replacing judgement or lacking transparency

Opaque, or replaces accountable human contribution, generates unverifiable outputs, compromises confidentiality or integrity, or violates applicable laws.

> Each class is named by its word as well as its colour, and the same model applies to authors, reviewers and editors.

TRAFFIC-LIGHT FRAMEWORK · GREEN

Green: assistive AI use

EXPECTATIONS

- AI use is likely to be reversible and verifiable.
- AI does not introduce new intellectual content.
- Accountability for scholarly or evaluative judgement remains clearly human.

COMPLIANCE AND DISCLOSURE

Permitted. Disclosure enhances trust and transparency and clearly demonstrates human accountability.

EXAMPLES

- Using an LLM to polish or refine the language
- Suggesting structure or formatting of manuscript sections
- Translation, structuring or clarifying reviewer comments
- Comparing methodological options
- Stress-testing research questions
- Data cleaning and deduplication

TRAFFIC-LIGHT FRAMEWORK · AMBER

Amber: evaluative or interpretive use

EXPECTATIONS

- AI contributes to reasoning or critique.
- AI introduces new intellectual content, so verification and oversight are required.
- Human judgement and accountability must be demonstrable.

COMPLIANCE AND DISCLOSURE

Permitted with human oversight, verification and disclosure. Where AI materially influences evaluative judgement, accountability must stay clearly human-led and defensible.

EXAMPLES

- Suggesting analytical, experimental or methodological approaches
- Drafting explanatory summaries
- Comparing results to existing literature
- Extensive copy editing or writing support
- Pattern identification in exploratory data analysis
- Explaining outputs from statistical models in plain language
- Recommending statistical tests or modelling approaches

TRAFFIC-LIGHT FRAMEWORK · RED

Red: use that is not permitted

EXPECTATIONS BREACHED

- AI use is opaque or creates non-verifiable outputs.
- Author, reviewer or editorial responsibility has been delegated to AI.
- AI use has breached confidentiality, consent or the rights of others.

COMPLIANCE AND DISCLOSURE

Not permitted.

EXAMPLES

- Generating hypotheses, analyses or conclusions and presenting them as human-derived
- Fabricating data, citations or results
- Using an LLM to generate core research reasoning without disclosure
- Assigning authorship or accountability to AI systems or tools
- Delegating peer review to an LLM
- Creating photorealistic images (deepfakes)

TRAFFIC-LIGHT FRAMEWORK

Compliance at a glance

Class	Nature of the use	Human role	Compliance and disclosure
Green	Assistive: expression, organisation or efficiency, with no influence on judgement	Accountability for scholarly or evaluative judgement is clearly human	Permitted. Disclosure builds trust and shows human accountability
Amber	Evaluative or interpretive: may influence interpretation, framing or emphasis	Verification and oversight; human judgement demonstrable and defensible	Permitted with oversight, verification and disclosure
Red	Replaces scholarly judgement, is opaque or non-verifiable, or breaches confidentiality	Responsibility delegated to AI, or others' rights breached	Not permitted

FOR AUTHORS

AI authorship: accountability stays human

AI cannot be an author

- LLMs such as ChatGPT do not meet the authorship criteria: they cannot take accountability for the work.
- AIGC tools lack legal status and cannot assume responsibility.
- Only humans who oversee and contribute intellectually may be authors.

What authors must do

- Stay accountable for AI use, and use it responsibly, lawfully and ethically.
- Know the risks first: AI models are known to plagiarise and to create false content.
- Check that AI-generated content is correct, properly referenced and meets the Authors’ Code of Conduct.

FOR AUTHORS

Declaring AI use: where and what

Generative AI tools	Declare use in the Introduction or Acknowledgements of the manuscript.
LLM use and the Methods section	The FAQ says LLM use is documented in the Methods section or equivalent. Book authors use the acknowledgements, introduction or preface.
What to disclose	Tool versions, usage dates, prompts and the extent of AI contribution within the manuscript.
AI-assisted copy editing	The group page says both that no declaration is needed and that it should be declared. The detailed manuscript policy puts grammar and language editing in green: describe the use and confirm accountability.

FOR AUTHORS

Responsible prompting

The quality of the output depends on the input. A prompt can be a question, instructions, data, images, video or a combination.

Protect

Do not include personal, sensitive, confidential or copyright-protected information in prompts.

Do not write prompts that could lead to harmful, malicious or unlawful outcomes.

Be mindful

Consider how you craft the prompt in terms of bias, in both input and output.

Take accountability for the impact of your prompts.

Test and learn

Test prompts before deploying them widely, to confirm appropriate and ethical responses.

Follow the AI Principles and keep up with AI ethics and best practice.

Core principles for generated content

Authorship

AIGC tools cannot be credited as authors because they lack legal status and cannot assume responsibility. Only humans who oversee and contribute intellectually may be authors.

Disclosure

Declare AIGC use fully and transparently, including tool versions, usage dates, prompts and the extent of AI contribution within the manuscript.

Data collection and literature review

AIGC may help gather and summarise literature or clarify concepts. Verify accuracy and authenticity, as references can be fabricated or outdated. Human oversight is mandatory.

Statistical analysis and interpretation

AIGC can help select statistical methods and run basic analyses. Researchers must validate results, apply expert judgement and cross-check suggestions with other tools or expert advice.

Figures, text and citations

Graph and image production

AIGC may recommend chart types and help with formatting and aesthetics without altering the authenticity of data or images. Generating or manipulating experimental images directly is prohibited unless the publisher explicitly approves. Brightness or contrast tweaks are fine if they do not obscure original information.

Text writing and language polishing

AIGC can improve readability, grammar and structure and aid drafting of literature reviews or summaries. It should not replace original scientific thinking, write entire manuscripts or interpret data. Review AI-generated text carefully for inaccuracies or bias.

Citation management

AIGC can check citation formats, generate references and sort bibliographies. Authors must ensure every citation is relevant, accurate and truthful. AI tools are aids, never substitutes, for scholarly responsibility.

FOR AUTHORS · IMAGES

Generative AI images in publications

Generally not permitted.

Springer Nature follows copyright law and publication ethics best practice, with limited exceptions. The detailed policy permits AI-assisted visuals built from verifiable data (see the visual content slide).

Image types covered

Video and animation (including stills), photography, illustration (scientific diagrams, photo-illustrations, collages) and editorial illustration (drawings, cartoons, 2D or 3D visuals).

Not covered, and non-generative tools

Not covered: tables, flow charts and simple graphs that contain no images.

Non-generative tools that manipulate, combine or enhance existing images should be disclosed in the caption at submission, for case-by-case review.

FOR PEER REVIEWERS

Can reviewers use generative AI?

Permitted

Secure or institutionally approved AI tools, in line with the AI policies and applicable laws.

Translating, structuring or clarifying reviewer comments.

Reviewers remain responsible for

Independent expert evaluation

Critical assessment of the manuscript

Recommendations provided to editors

The content of their review report

Not permitted

Delegating peer review to an LLM.

Uploading manuscript content to unsecured or public AI systems.

> AI may support reviewers, but it cannot replace reviewer expertise, critique or judgement.

FOR PEER REVIEWERS · CONFIDENTIALITY

Secure tools and AI detectors

Secure or institutionally approved tools

Examples are enterprise systems with appropriate data protection. Depending on the tool's data and privacy policies and settings, limited use of manuscript content may be acceptable.

REVIEWERS SHOULD

- Confirm the tool's data policies.
- Follow institutional guidance and approval.
- Use AI proportionately and cautiously.

Caution: AI detectors

Some enterprise and institutional AI detectors can retain and train on uploaded content. That makes them inappropriate for unpublished manuscripts, because uploading would breach confidentiality.

Terms of service, data retention and model-training provisions vary considerably between systems.

Confidentiality of unpublished manuscripts and compliance with applicable laws must be guaranteed at all times.

FOR EDITORS

Editorial accountability and AI

Decisions remain human

Accountability for editorial decisions cannot be delegated to AI systems.

AI supports, never decides

AI may assist clarity, efficiency and exploration but must not determine conclusions, evaluations or decisions.

Confidentiality applies

Manuscripts, peer review reports and sensitive data must not be shared with unsecured or public AI systems.

Checking AI-assisted content

Where AI helps produce accessory content, the author and/or editor edits and fact-checks it.

Detailed editor guidance follows in the next section: assessing declarations, the limits of AI detectors and when to seek clarification.

FOR EDITORS AND THE PUBLISHER

How Springer Nature uses AI itself

Supporting editorial content

Some journals and books use internal Springer Nature AI tools to help generate accessory content. The author and/or editor always edits and fact-checks it.

ACCESSORY CONTENT INCLUDES

- Key points and editorial summaries
- Glossary terms and plain language summaries

Any substantive use beyond accessory content is declared per article or chapter.

AI in the wider context

Springer Nature has used AI for over ten years to help researchers publish faster, find content quickly, protect the academic record and reduce barriers. Any new use is tested against three questions:

- Does it benefit customers and the wider research community?
- Is there a human in the loop?
- Does it meet the AI governance principles of fairness, transparency, accountability and respect?

DETAILED POLICIES

One framework, four contexts

AI use in manuscript preparation

Writing, language and visual content. Authors stay fully accountable for everything submitted in their name.

AI use in research practice

Literature, data, analysis and modelling. Judged by how AI is used, not by the specific tool.

AI use in peer review

The report must remain the reviewer’s own independent expert judgement, with confidentiality upheld.

Editor AI use and assessment

How editors assess AI use and declarations, and the limits of AI detection tools.

> Every page uses the same green, amber and red logic, with the examples tailored to the activity.

AI in writing and language

Green · Low risk

Uses. Grammar and language editing, readability and flow, formatting, translation, summarising author-written text.

Care. Check outputs for accuracy and meaning.

Declare. Describe the use and confirm author accountability.

Amber · Caution and care

Uses. Generating outlines, drafting sections from author input, suggesting alternative phrasing or framing, reference management support, visuals from verifiable source data.

Care. Generic or inaccurate content, loss of disciplinary voice, fabricated citations. Label all AI-generated or AI-assisted content.

Declare. Describe the use and confirm author accountability.

Red · Not permitted

Examples. Writing results or discussion independently, generating scientific claims or interpretations, producing data or figures presented as empirical, listing AI as an author, creating content from text prompts or without verifiable source material.

Declare. Not permitted.

> AI can assist with expression, but the argument, interpretation and conclusions must be led by the author.

AI-assisted visual content

Permitted when inputs are verifiable

- AI use is disclosed, including the model and purpose.
- Data, sources, methods or computational outputs can be inspected, verified and attributed.
- AI-assisted processing, analysis or code has had human review and validation.
- The visual accurately represents the evidence, and no IP rights are infringed.

Examples. Charts from datasets, visualisations of computational outputs, diagrams from author-developed content, figures from code the author has reviewed and verified.

Not permitted without verifiable inputs

Visuals not derived from independently verifiable data, sources, methods, outputs or author-developed content are opaque. Others must be able to assess how the content was made.

Non-generative tools and disclosure

Machine learning used to analyse, restore, segment or enhance existing visuals may be permitted if the original stays attributable and is not misrepresented.

Disclose the AI system, purpose and extent in an AI Declaration, and in the caption or legend.

AI in the research process

Class	Typical uses	Key considerations	Declaration
Green	Literature discovery and search, summarising public literature, data cleaning and deduplication, code scaffolding, project planning	Review, verify and understand outputs; avoid over-reliance	Describe the tool and its purpose; take accountability
Amber	Pattern identification, supporting statistical modelling, qualitative coding, explanatory summaries or comparisons	Bias, lack of transparency, reduced reproducibility, loss of nuance; human validation essential	Methodological description and validation steps; take accountability
Red	Hypotheses, analyses or conclusions without human oversight; fabricated data or references; sensitive or restricted data in public tools	Undermines accountability, reliability and ethical standards	Not permitted

> Care scales with risk. Authors should be able to explain how AI was used, which inputs and outputs were involved, and how results were validated.

Discipline-specific considerations

Quantitative research

Keep methods transparent and reproducible. AI may explore large datasets or support modelling. Describe inputs, outputs and validation steps so others can reproduce and assess the results.

Qualitative research

Preserve nuance and show human-led argument. AI may assist with coding or theme identification, but interpretation must remain human-led.

Social or online data

Reflect on bias, context and ethics. Classification or sentiment analysis needs critical human reflection and strict adherence to privacy and consent expectations.

Evidence synthesis

Ensure completeness, accuracy and verifiability. AI can manage large volumes of evidence but may omit key studies, oversimplify findings or fabricate content. Document the methodology clearly.

> Acceptability depends on whether AI supports transparency, rigour and integrity, not on the tool itself.

Reviewer use of AI by risk level

Green · Low risk

Uses. Improving clarity, tone and structure of comments; organising notes; generating checklists such as CONSORT or PRISMA; summarising reviewer notes.

Care. Outputs stay under reviewer control and do not influence critical assessment.

Declare. Describe the use and take accountability for the whole report.

Amber · Caution and care

Uses. Identifying areas to probe, exploring potential limitations, comparing against general literature patterns, stress-testing the reviewer's own reasoning.

Care. Manage confidentiality for the tool used, verify outputs, apply discipline-specific judgement.

Declare. Describe how AI was used and confirm independent judgement.

Red · Not permitted

Examples. Uploading manuscripts to public or unsecured tools, generating full review reports, producing accept or reject recommendations, delegating critique to AI.

Why. It undermines confidentiality, independence and accountability.

> Declaring AI use does not negatively affect the reviewer's role. The review must be clearly human-led, defensible and accountable.

Choosing an AI tool: look at the data handling

Question	What to look for	In practice
Is it a public or open tool?	Terms saying inputs may improve services	Inputs may be stored or reused. Do not upload manuscript content.
Is it provided by your institution?	University- or organisation-approved tools	Unclear or missing data-handling information means higher risk.
Can data retention be disabled?	Opt-out or “no training” settings	Reduces risk.
Is it built for secure workflows?	Enterprise or controlled tools, or local LLMs	Stronger data protection. Local LLMs can run offline on your own hardware.

> AI detection tools: institutional or enterprise versions may retain or train on uploads, which makes them inappropriate for unpublished manuscripts.

Four safe approaches for reviewers

1. Work from your own notes

Avoid. Uploading the methods section and asking for weaknesses.

Do. Share your own paraphrased summary and ask which other limitations to consider.

2. Abstract rather than quote

Avoid. Pasting the manuscript's dataset description.

Do. Describe general pitfalls for the data type in your own words and ask what else to consider.

3. Ask what to look for

Avoid. Asking whether a trial is strong enough to publish.

Do. Ask about common limitations of a design, or request a reporting-standard checklist.

4. Stress-test your reasoning

Avoid. Letting AI form the interpretation.

Do. Write your own view first, ask for alternatives, then verify and keep only what withstands scrutiny.

> Use AI to challenge reasoning, not to generate it. Evaluation and recommendations stay with the reviewer.

How editors assess AI use

AI detection tools: extreme caution

- Not definitive, with limited accuracy. No tool can confirm AI use was safe or compliant.
- Some enterprise or institutional detectors retain and train on uploads, so they are unsuitable for unpublished manuscripts.
- Do not upload manuscripts to public or open AI tools to help evaluate them.

The goal is to understand and manage risk, not to identify or penalise AI use.

Assessing a declaration

EDITORS CONSIDER

- The nature and extent of AI involvement.
- The impact on accuracy, originality, attribution and integrity.
- Whether use was disclosed transparently.

MAY SEEK CLARIFICATION WHEN

- The declaration lacks detail.
- The declared use conflicts with policy or with the manuscript or report.
- There are concerns about accountability, integrity, confidentiality or transparency.

Declarations: why, and what to expect

Why declare

- Declaring does not negatively influence editorial decisions.
- It enables transparent, fair evaluation of the work on its scholarly merit.
- Unclear or undeclared use may prompt queries that delay review.

Why authors hold back

The editor guidance notes that researchers often under-declare or do not declare, mainly from fear of biased handling, biased peer review or an assumption of lower quality.

It cites BaHammam (2025) and Staiman (2026).

The rollout

- Declarations are expected to become routine at submission, including “no AI used”.
- Authors and reviewers will confirm they have read and complied with the AI Editorial Policies.
- Detail may vary during adoption. Disclosure alone is not a cause for concern.

BOOK AUTHORS · CODE OF CONDUCT, VERSION 1.0, OCTOBER 2019

Conduct standards for book authors

Research conduct

Results presented honestly, with no fabrication, falsification or inappropriate manipulation, including images.

Authorship

Substantial contributors only. No honorary authorship. Co-authors share accountability. No changes once in production.

Originality

No plagiarism or redundant publication. Overlap with earlier work must be made transparent. Plagiarism screening software may be used.

Sources

Acknowledge others' work. Make clear which text is your own and which is verbatim, summarised or paraphrased.

Permissions and images

Secure permission for third-party text and images. Web-accessible does not mean freely reusable.

Confidentiality

Treat communications with editors and the publisher, and reviewers' reports, as confidential, as well as manuscripts received for review.

> This 2019 document does not mention AI. Suspected misconduct is investigated under COPE guidelines, and measures range from rejection to erratum or retraction.

BOOK AUTHORS · INTERPRETATION BY THIS DECK

Reading the book code with the AI policies

Book code principle	What it implies for AI use
Authorship: substantial contribution only	AI cannot be an author. Listing AI as an author is red in the manuscript-preparation policy.
Research conduct: no fabrication or manipulation	Fabricated data, figures or references are red. AI visuals need verifiable source data.
Originality and acknowledgement of sources	Check AI output for plagiarism and make clear what is your own text. Verify that references are real.
Permissions, figures and copyright	You remain responsible for IP, licensing and consent, including for AI-assisted visuals.
Confidentiality	Keep confidential communications and review material out of public AI tools.

PRACTICE · OPTIMISATION CASES (1 OF 2)

Research, code and proofs

Classify each case as green, amber or red, and say what you would declare.

1

You ask an LLM to scaffold MATLAB code for a benchmark harness, then read, run and test every function yourself.

2

You ask an LLM which line-search or step-size strategy suits your problem class, and you build its suggestion into your algorithm.

3

An LLM drafts the proof of a convergence theorem. You skim it, fix the notation and paste it into the manuscript as your own work.

4

An LLM suggests a proof strategy. You derive and check every step yourself, and you say so in the manuscript.

PRACTICE · OPTIMISATION CASES (2 OF 2)

References, figures and review

Classify each case as green, amber or red, and say what you would declare.

5

You ask an LLM for related-work references with BibTeX entries and paste them in without looking each one up.

6

Your performance-profile figures come from plotting code an LLM helped write. You reviewed the code and the result files.

7

You prompt an image generator for a picture of a loss landscape to illustrate the introduction.

8

As a reviewer, you paste the manuscript’s algorithm and proof into a public chatbot and ask whether the proof is correct.

PRACTICE · SUGGESTED ANSWERS (1 OF 2)

Research, code and proofs

Case	Class	Why, and what to do
1	Green	Code scaffolding is a green research use. Review, verify and understand the output. Declare the tool and its purpose and take accountability.
2	Amber	Suggesting methodological approaches is amber. Validate the strategy analytically and numerically, and give a methodological description with validation steps.
3	Red	Generating conclusions or claims without human oversight, and presenting AI reasoning as your own, are red. Check every step yourself and disclose, which moves it to case 4. Applied by analogy.
4	Amber	AI contributes to reasoning, so verification and demonstrable human judgement are required, with disclosure. Applied by analogy.

References, figures and review

Case	Class	Why, and what to do
5	Red	Unchecked references risk fabricated citations, which are red. Reference management support is amber once every entry is looked up and matched to its source, and the use is described.
6	Amber	A visual from verifiable data and reviewed code is permitted with disclosure. Name the AI system, purpose and extent in the AI Declaration and in the caption.
7	Red	A visual not derived from verifiable data, sources or author-developed content is opaque and not permitted. Plot the function from code you control and disclose any AI help.
8	Red	Uploading a manuscript to a public tool breaches confidentiality. Instead, describe the general proof technique in your own words and ask about common pitfalls, then declare.

Before you submit

- ✓ **Code.** Every AI-assisted file is reviewed, run and tested. The tool and its purpose are declared.
- ✓ **Proofs.** Each step is checked by a human. Any AI role in strategy or drafting is described (applied by analogy).
- ✓ **Numerical results.** Every number comes from your own runs. None is produced or edited by AI.
- ✓ **Reproducibility.** Inputs, outputs and validation steps are described so others can reproduce the work.
- ✓ **References.** Each one is looked up and matched to its source. None is fabricated.
- ✓ **Figures.** Built from verified data and code. The AI Declaration and caption name the system, purpose and extent.
- ✓ **Confidentiality.** No unpublished third-party material, review reports or sensitive data went into public tools.
- ✓ **Declaration.** Made as the journal or book requires. AI is not listed as an author and all authors are accountable.

PRACTICE · REVIEWER CHECKLIST

Before you submit a report

- ✓ **Judgement.** The evaluation and recommendation are mine. AI did not draft the report or the verdict.
- ✓ **Confidentiality.** No text, equations, code or data from the manuscript went into a public or unsecured tool.
- ✓ **Detectors.** I did not run the unpublished manuscript through an AI detector.
- ✓ **Tool choice.** If I used a secure tool, I confirmed its data policies and my institution’s approval, and kept use limited.
- ✓ **Method.** I worked from my own notes and abstracted descriptions, and verified every AI output.
- ✓ **Declaration.** I described how AI was used and confirmed my independent judgement.

SUMMARY

Five takeaways

1. Humans stay accountable. AI cannot be an author, and it cannot do the peer review.
2. Judge each use by how AI was used, its impact, its risk, the oversight and the transparency.
3. Green is permitted, amber needs human oversight and disclosure, red is not permitted.
4. Never place manuscripts, review reports or sensitive data in unsecured or public AI tools.
5. AI visuals need verifiable source data, and generated images without it are not permitted. Declare AI use as the policies require.

Code of Conduct for Book Authors, version 1.0, October 2019
PDF supplied by the presenter

Scope and caveats

> The web pages were read on 19 and 25 October 2026. The book code is a 2019 PDF that does not mention AI.

> The group page and the detailed policies differ in places, for example on images and copy editing. Check your journal's own instructions.

> Scenarios, the checklist and the book-code mapping are synthesised for training, not official text.
